AutoCAD Crack Product Key [Win/Mac]

In AutoCAD 2009, the 2006 model was enhanced with a whole new programming language (AutoLISP) and a new architecture called Client Server that performs better than before. AutoCAD is often considered the best software for architectural and engineering design. The first version of AutoCAD, released in 1983, was for DOS and the Apple II. AutoCAD for DOS (and other DOS-based programs such as AutoCAD LT) had an important predecessor called "AutoSketch", which came with the "Acorn" operating system. AutoCAD was later developed for the Macintosh and Unix platforms. The GUI was introduced in AutoCAD 1984. The original Mac version was released as a "limited release". Features of AutoCAD 2009 In addition to architectural and engineering design, AutoCAD 2009 has many more built-in functions than its predecessors. A brand-new feature, the "Insert" function, allows users to automatically insert lines and shapes into another drawing. Similar features are available for the Move, Copy, and Delete commands. A new "Change" menu item makes it easier to change the current coordinate system. New AutoCAD features include: Drafting area: The new "Drafting Area" feature in the drawing pane can be used to create a working area for the first time. A "Drafting Area" can be set to any orientation and size, and it can be used with both current and future drawings. Image Capture (or Stenciling): AutoCAD 2009 introduced a new "Image Capture" feature that allows you to create a new drawing by scanning existing drawings or documents. A scanned drawing can be stored as a "Stencil" on disk, or can be captured as a separate image. The captured image can be "opened" directly in AutoCAD and used to create any shape. For example, a scanned copy of an architectural drawing can be used as a stamp to create a model. Image Capture has been made available in all AutoCAD versions from AutoCAD 2003 to AutoCAD 2009. The "Stencil" is also available in most AutoCAD versions, but it works only with AutoCAD 2009. Live View: Live View was first introduced in the AutoCAD 2005. Live View is a combination of an on-screen display (OSD) and a user interface (UI). AutoCAD Live View is used to update a drawing without closing the current drawing

AutoCAD is used in the construction industry and the manufacturing industry. With the advent of CAD, engineering functions have been redesigned to fit the CAD environment. An example of this is the use of a tool called A-SPQR. It allows the user to find common features of multiple drawings, even if they have not been prepared by the same engineer. AutoCAD has also been used in academic institutions to analyze and design software or to create financial models. For example, the University of Calgary has released the open-source projects, AutoCAD2 (or AutoCAD Community) and AutoCAD2ER, to help students create a large variety of CAD models and GIS software. Language environment AutoCAD supports AutoLISP, Visual LISP, VBA and .NET. AutoLISP was introduced in AutoCAD version 2002. It is an interpreted scripting language similar to BASIC that uses Emacs-style keystrokes. AutoLISP is only partially implemented in AutoCAD 2009. Visual LISP was introduced in AutoCAD 2007. It uses the Visual Basic scripting language. VBA is a Microsoft Visual Basic for Applications language for AutoCAD. It is integrated with AutoCAD 2007. ObjectARX is a C++ class library for AutoCAD and it is designed to make programming in C++ easier by providing a "managed" programming environment and class design pattern. Custom objects Custom objects are objects in AutoCAD that are not part of the base product and that can be created by the user. A custom object can be created in two ways. First, a new object can be created from scratch, using the Customize User Interface (CUI). Second, an existing object can be used as a template, by transferring its properties (User Interface Items, or UIIs) to a new object using the Import Existing Data (IED) command. The latter method is used to create a new object from a template object. Using templates, custom objects can be created from a set of predefined attributes, which are grouped into families. Families are referred to as "templates", which are stored as attributes in a Custom Object Attribute Table (COT). If the same attribute is found in a COT and an active drawing, the drawing can be used as a template and the attribute can be used to define a custom object. Custom objects can be nested 5b5f913d15
